Week 3

Class Activity

Anonymisation, Privacy Preservation, Both, or Neither

Case Study 1 – Fitness Tracker Research Dataset

A fitness company releases data from wearable devices for research. The dataset includes step counts, heart-rate trends, and GPS paths but omits names and email addresses.

Case Study 2 – Smart Home Voice Assistant

A smart home company records short voice clips from customer devices to improve speech recognition. The clips are encrypted during transfer and stored centrally for later analysis by AI engineers.

Case Study 3 – Online Learning Dashboard

An e-learning platform shares analytics data with universities, replacing names with random IDs but keeping timestamps and course details.

Case Study 4 – Medical AI Consortium

Hospitals collaborate to develop an AI diagnostic tool using homomorphic encryption. Each site trains models locally and shares only encrypted computations.

Case Study 5 – Public Transport Survey

A city government releases only aggregated statistics (e.g., average journey times per route) with no individual-level data.
